

## VOLTAGE CONVERTER

### ■ GENERAL DESCRIPTION

The NJU7662 is a voltage converter incorporated CR-oscillator, voltage-level-shifter and power-MOS, which generates a polarity-converted negative voltage or two-fold voltage of an operating voltage ranging from +4.5 to +20.0V.

The application circuit of negative voltage converter requires only two capacitors, and positive twofold voltage converter requires two capacitors, two resistors and one diode as external components.

The oscillation frequency of the internal oscillator is 10kHz and the negative voltage converter (on no-load condition) achieves extremely high-efficiency voltage conversion rate of 99.9%.

### ■ PIN CONFIGURATION

## ■ APPLICATION CIRCUITS

(1-1) NEGATIVE VOLTAGE OUTPUT

(1-2) NEGATIVE VOLTAGE OUTPUT

(\*)1) No. 6 Terminal must connect to GND or Open  
according to the operating voltage as follows;  
 $V_+ < 6V$  --- Connect to GND  
 $V_+ \geq 6V$  --- OPEN

(2) TWO FOLD VOLTAGE OUTPUT

In the twofold voltage application,  
R1, Rs and D1 are required for start-up.
