

# **±70V Fault-Protected, 3.0V to 5.5V, 2Tx/2Rx RS-232 Transceiver**

**MAX13223E**

## **General Description**

The MAX13223E is a +3.0V to +5.5V-powered EIA/TIA-232 and V.28 communications interface with fault protection on the RS-232 line interface. This allows shorts of the transmitter outputs and receiver inputs to voltages in the ±70V range without adversely affecting the MAX13223E.

The MAX13223E achieves 1µA supply current using Maxim's AutoShutdown™ feature. The MAX13223E automatically enters a low-power shutdown mode when the RS-232 cable is disconnected or the receivers are inactive. The device turns on again when a valid transition at any receiver input is sensed. A proprietary, high-efficiency, dual charge-pump power supply and a low-dropout transmitter combine to deliver true RS-232 performance from a single +3.0V to +5.5V supply.

The MAX13223E has two receivers and two drivers and is guaranteed to run at data rates of 250kbps for one transmitter switching while maintaining RS-232 output levels.

The MAX13223E operates from input voltages ranging from +3.0V to +5.5V and is available in a 20-pin, 6.5mm x 4.4mm, TSSOP package. The MAX13223E is specified over the -40°C to +85°C temperature range.

## **Applications**

- Automotive
- Telematics Equipment
- Base Stations
- Utility Meters
- Industrial Equipment
- Telecomm Equipment
- POS Terminal Equipment

*AutoShutdown is a trademark of Maxim Integrated Products, Inc.*

## **Features**

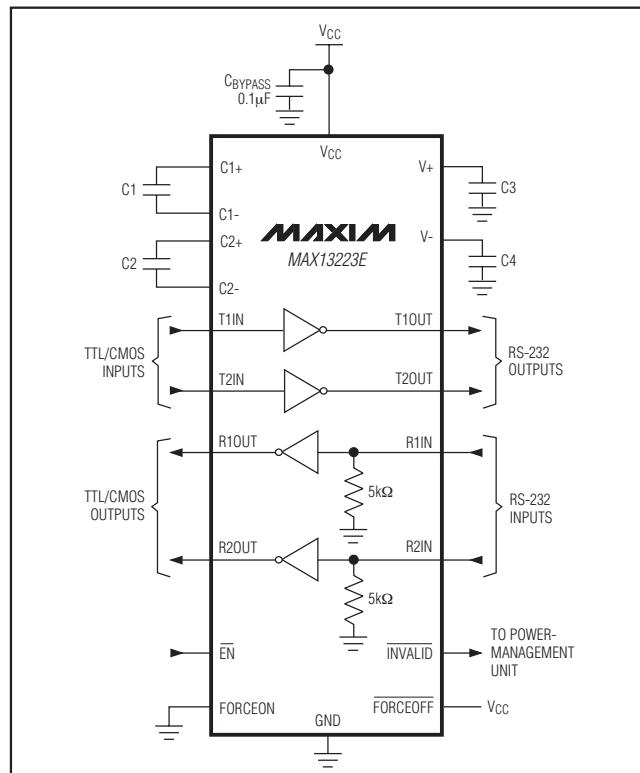

- ◆ **±70V Fault Protection**
- ◆ **+3.0V to +5.5V Supply Voltage**
- ◆ **Oversupply Current Limiting**
- ◆ **Current Protection at Transmitter Outputs**
- ◆ **AutoShutdown**
- ◆ **250kbps (Max) Data Rate**
- ◆ **Low Current Consumption in Shutdown 1µA (typ)**
- ◆ **Thermal Shutdown Protection**
- ◆ **±8kV IEC 61000-4-2 Contact-Discharge Method**
- ◆ **-40°C to +85°C Operating Temperature Range**

## **Ordering Information**

PART	TEMP RANGE	PIN-PACKAGE
MAX13223EEUP+	-40°C to +85°C	20 TSSOP

+Denotes a lead(Pb)-free/RoHS-compliant package.

## **Typical Operating Circuit**

# **±70V Fault-Protected, 3.0V to 5.5V, 2Tx/2Rx RS-232 Transceiver**

## **ABSOLUTE MAXIMUM RATINGS**

(Voltages referenced to GND.)

V <sub>CC</sub> .....	-0.3V to +7.0V
V <sub>+</sub> .....	-0.3V to +7.0V
V <sub>-</sub> .....	+0.3V to -7.0V
V <sub>+</sub> to V <sub>-</sub> .....	+13V
Input Voltages	
T1IN, T2IN, EN, FORCEON, FORCEOFF .....	-0.3V to +6.0V
R1IN, R2IN .....	±70V
Output Voltages	
T1OUT, T2OUT .....	±70V
R1OUT, R2OUT, INVALID .....	-0.3V to (V <sub>CC</sub> + 0.3V)

### Short-Circuit Duration

T1OUT, T2OUT.....	Continuous
Continuous Power Dissipation (T <sub>A</sub> = +70°C)	
TSSOP (derate 13.6mW/°C above +70°C) .....	1084mW
Operating Temperature Range .....	-40°C to +85°C
Junction Temperature .....	+150°C
Storage Temperature Range .....	-65°C to +150°C
Lead Temperature (soldering, 10s) .....	+300°C
Soldering Temperature (reflow) .....	+260°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## **PACKAGE THERMAL CHARACTERISTICS (Note 1)**

### TSSOP

Junction-to-Ambient Thermal Resistance (θ <sub>JA</sub> ) .....	73.8°C/W
Junction-to-Case Thermal Resistance (θ <sub>JC</sub> ) .....	20°C/W

**Note 1:** Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to [www.maxim-ic.com/thermal-tutorial](http://www.maxim-ic.com/thermal-tutorial).

## **ELECTRICAL CHARACTERISTICS**

## **Pin Description**

PIN	NAME	FUNCTION
1	EN	Receiver Enable Control Input. Drive EN low for normal operation. Drive EN high to force the receiver outputs (R1OUT, R2OUT) into a high-impedance state.
2	C1+	Positive Terminal of the Voltage Doubler Charge-Pump Capacitor
3	V+	+5.5V Generated by Charge Pump
4	C1-	Negative Terminal of the Voltage Doubler Charge-Pump Capacitor
5	C2+	Positive Terminal of Inverting Charge-Pump Capacitor
6	C2-	Negative Terminal of Inverting Charge-Pump Capacitor
7	V-	-5.5V Generated by Charge Pump
8	T2OUT	RS-232 Transmitter 2 Output
9	R2IN	RS-232 Receiver 2 Input
10	R2OUT	Receiver 2 Logic Output
11	INVALID	Valid Signal Detector Output. INVALID is high if a valid RS-232 level is present on any receiver input.
12	T2IN	Transmitter 2 Logic Input
13	T1IN	Transmitter 1 Logic Input
14	FORCEON	Active-High FORCEON Input. Drive FORCEON high to override AutoShutdown, keeping transmitters and charge pump on (FORCEOFF must be high).
15	R1OUT	Receiver 1 Logic Output
16	R1IN	RS-232 Receiver 1 Input
17	T1OUT	RS-232 Transmitter 1 Output
18	GND	Ground
19	VCC	+3.0V to +5.5V Supply Voltage. Bypass VCC with a 0.1 $\mu$ F ceramic capacitor located as close to the device as possible.
20	FORCEOFF	Active-Low FORCEOFF Input. Drive FORCEOFF low to shut down transmitters, receivers, and on-board charge pumps, overriding AutoShutdown and FORCEON.

## **Detailed Description**

Figure 2 shows the receiver test circuit. Figure 3 shows driver propagation delay and Figure 4 shows receiver propagation delay.

### **Dual Charge-Pump Voltage Converter**

The MAX13223E internal power supply consists of a dual-mode regulated charge pump that provides output voltages of +5.5V (doubling charge pump) and -5.5V (inverting charge pump), regardless of the input voltage (VCC) over the +3.0V to +5.5V range. The charge pumps operate in a discontinuous mode. If the output voltages are less than 5.5V, the charge pumps are enabled. If the output voltages exceed 5.5V, the charge pumps are disabled. Each charge pump requires a flying capacitor (C1, C2) and a reservoir capacitor (C3, C4) to generate the V+ and V- supplies.

### **RS-232 Transmitters**

The transmitters are inverting level translators that convert logic levels to EIA/TIA-232/V.28 levels. They guarantee a 250kbps data rate with worst-case loads of 3k $\Omega$  in parallel with 1000pF, providing compatibility with PC-to-PC communication software. The MAX13223E can operate at data rates of 250kbps (max). Transmitters can be paralleled to drive multiple receivers. When FORCEOFF is driven to ground, or the AutoShutdown circuitry senses invalid voltage levels at all receiver inputs, the transmitters are disabled and the outputs are forced into a high-impedance state. Figure 5 shows a complete system connection.

### **RS-232 Receivers**

The MAX13223E's receivers convert RS-232 signals to logic output levels. Both receiver outputs can be three-stated using the EN input. In shutdown (FORCEOFF or AutoShutdown), the MAX13223E's receiver outputs are active and asserted low if EN = Low (Table 1). Driving EN high places the receivers' outputs in a high-impedance state.

# **±70V Fault-Protected, 3.0V to 5.5V, 2Tx/2Rx RS-232 Transceiver**

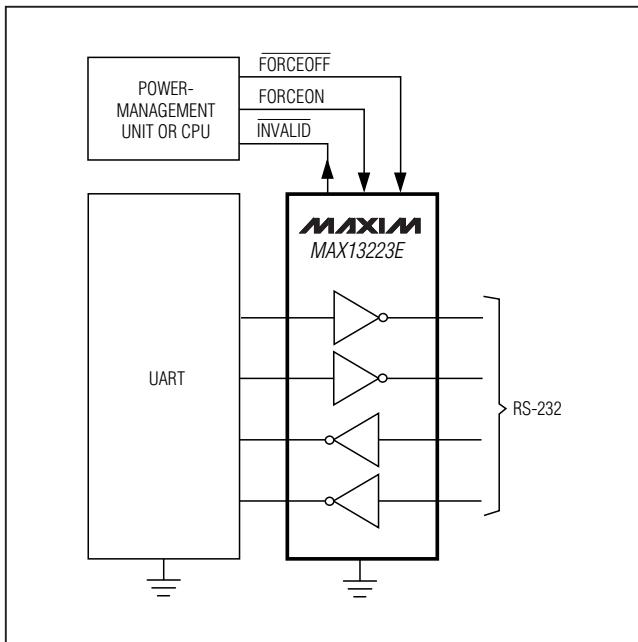

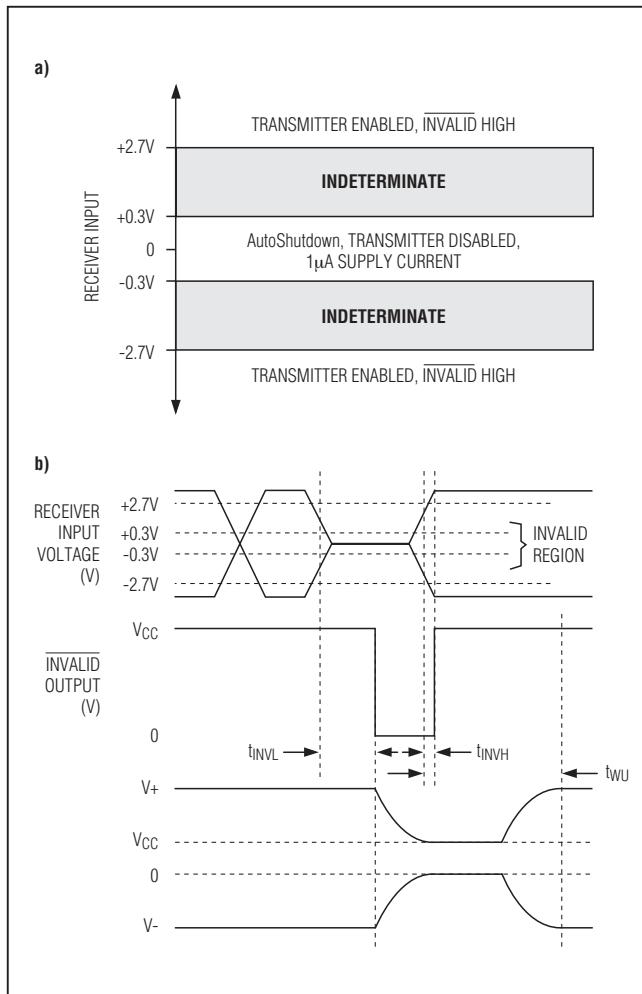

Figure 5. Interface Under Control of PMU

**Table 1. Receiver Control Truth Table**

EN	OPERATION MODE	R_OUT
0	Active (FORCEON), or Active (AutoShutdown)	Active
0	Shutdown (FORCEOFF), or Shutdown (AutoShutdown)	Active and asserted low
1	Shutdown status is don't care	High impedance

### **AutoShutdown**

The MAX13223E achieves 1µA supply current with Maxim's AutoShutdown feature, which operates when FORCEON is low and FORCEOFF is high. When the device senses no valid signal levels on both receiver inputs for > 30µs (typ), the onboard charge pump and drivers are shut off, reducing supply current to 1µA. This occurs if the RS-232 cable is disconnected or the connected peripheral transmitters are turned off. The device turns on again when a valid level is applied to either RS-232 receiver input. As a result, the system saves power. Table 2 summarizes the MAX13223E's operating modes. FORCEON and FORCEOFF override

Figures 6a and 6b. Trip Levels for Entering and Exiting AutoShutdown

AutoShutdown. When neither control is asserted, the IC selects between these states automatically, based on receiver input levels. Figure 6a shows the input levels and Figure 6b shows the timing diagram for AutoShutdown operation.

### **Software-Controlled Shutdown**

If direct software control is desired, INVALID can be used to indicate a DTR or Ring indicator signal. Connect FORCEOFF and FORCEON together to bypass AutoShutdown; therefore, the line acts as a SHDN input.

# **$\pm 70V$ Fault-Protected, 3.0V to 5.5V, 2Tx/2Rx RS-232 Transceiver**

**Table 2. AutoShutdown Control**

INPUTS			OUTPUTS		
FORCEOFF	FORCEON	VALID RECEIVER INPUT LEVEL	INVALID OUTPUT	OPERATION MODE	T_OUT
0	X	No	0	Shutdown (Forced Off)	High-Z
0	X	Yes	1	Shutdown (Forced Off)	High-Z
1	0	No	0	Shutdown (AutoShutdown)	High-Z
1	0	Yes	1	Active (AutoShutdown)	Active
1	1	No	0	Active (Forced On)	Active
1	1	Yes	1	Active (Forced On)	Active

X = Don't Care.

## **Applications Information**

### **Capacitor Selection**

The capacitor type used for C1–C4 is not critical for proper operation; either polarized or nonpolarized capacitors may be used. The charge pump requires 0.1 $\mu$ F capacitors for 3.3V operation. For other supply voltages, see Table 3 for required capacitor values. Do not use values smaller than those listed in Table 3. Increasing the capacitor values (e.g., by a factor of 2) reduces ripple on the transmitter outputs and slightly reduces power consumption. C2, C3, and C4 can be increased without changing C1's value. **However, do not increase C1 without also increasing the values of C2, C3, and C4 to maintain the proper ratios (C1 to the other capacitors).** When using the minimum required capacitor values, make sure the capacitor value does not degrade excessively with temperature. If in doubt, use capacitors with a larger nominal value. The capacitor's equivalent series resistance (ESR) usually rises at low temperatures and influences the amount of ripple on V+ and V-.

**Table 3. Required Capacitor Values**

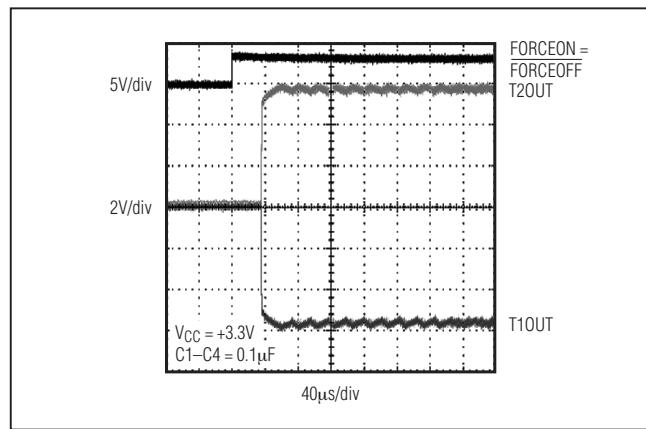

V <sub>CC</sub> (V)	C <sub>1, CBYPASS</sub> ( $\mu$ F)	C <sub>2, C3</sub> ( $\mu$ F)	C <sub>4</sub> ( $\mu$ F)
3.0 to 3.6	0.1	0.1	1
4.5 to 5.5	0.047	0.33	1

### **Power-Supply Decoupling**

In most circumstances, a 0.1 $\mu$ F V<sub>CC</sub> bypass capacitor is adequate. In applications that are sensitive to power-supply noise, decouple V<sub>CC</sub> to ground with a capacitor of the same value as the charge-pump capacitor C1. Connect bypass capacitors as close to the IC as possible.

### **Transmitter Outputs when Exiting Shutdown**

Figure 7 shows two transmitter outputs when exiting shutdown mode. As they become active, the two transmitter outputs are shown going to opposite RS-232 levels. Each transmitter is loaded with 3k $\Omega$  in parallel with 2500pF. The transmitter outputs display no ringing or undesirable transients as they come out of shutdown. Note that the transmitters are enabled only when the magnitude of V- exceeds approximately 3V.

*Figure 7. Transmitter Outputs when Exiting Shutdown or Powering Up*

# **$\pm 70V$ Fault-Protected, 3.0V to 5.5V, 2Tx/2Rx RS-232 Transceiver**

## **Fault Protection**

The MAX13223E is designed to survive faults such as direct shorts to power supplies, miswiring faults, connector failures, and tool misapplications of the transmitter outputs and receiver inputs to voltages in the  $\pm 70V$  range without damage. This fault protection is applicable in all modes of the MAX13223E: active, shutdown, and powered down. Both receivers operate over the  $\pm 70V$  input range, but the termination resistor ( $R_{RX,I}$ ) increases when  $IVR_{INL}$  voltage exceeds  $\pm 32V$ . A receiver's input termination resistor reduces to its nominal value if the input voltage reduces to within the  $\pm 24V$  range. The receiver inputs and transmitter outputs are independently fault protected.

## **$\pm 8kV$ ESD Protection**

As with all Maxim devices, ESD-protection structures are incorporated on all pins to protect against electrostatic discharges encountered during handling and assembly. In using the MAX13223E, C4 must be a  $1\mu F$  capacitor for the extended ESD protection. The driver outputs and receiver inputs of the MAX13223E have extra protection against static electricity. Maxim's engineers have developed state-of-the-art structures to protect these pins against ESD of  $\pm 8kV$  without damage. The ESD structures withstand high ESD in all states: normal operation, shutdown, and powered down. After an ESD event, Maxim's E versions keep working without latchup, whereas competing RS-232 products can latch and must be powered down to remove latchup. ESD protection can be tested in various ways. The transmitter outputs and receiver inputs of this product family are characterized for protection to the following limits:

- 1)  $\pm 8kV$  using the Human Body Model
- 2)  $\pm 8kV$  using the Contact-Discharge Method specified in IEC 61000-4-2

## **ESD Test Conditions**

ESD performance depends on a variety of conditions. Contact Maxim for a reliability report that documents test setup, test methodology, and test results.

## **Human Body Model**

Figure 8a shows the Human Body Model and Figure 8b shows the current waveform it generates when discharged into a low impedance. This model consists of a  $100pF$  capacitor charged to the ESD voltage of interest, which is then discharged into the test device through a  $1.5k\Omega$  resistor.

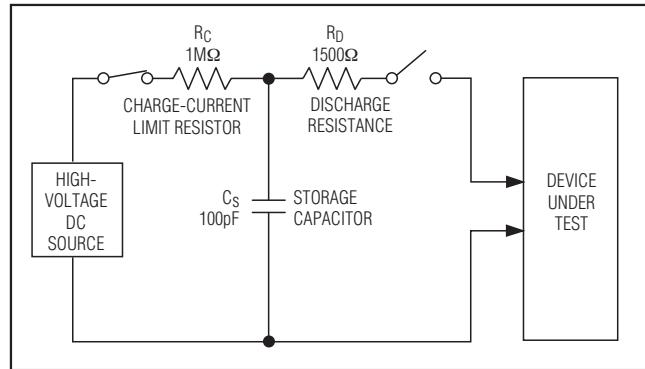

Figure 8a. Human Body ESD Test Model

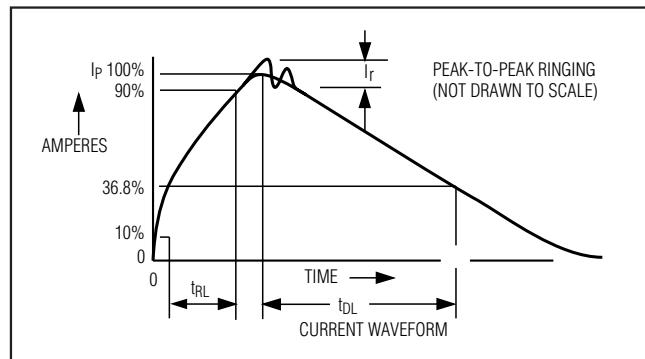

Figure 8b. Human Body Current Waveform

## **IEC 61000-4-2**

The IEC 61000-4-2 standard covers ESD testing and performance of finished equipment. It does not specifically refer to integrated circuits. The major difference between tests done using the Human Body Model and IEC 61000-4-2 is higher peak current in IEC 61000-4-2, because series resistance is lower in the IEC 61000-4-2 model. Hence, the ESD withstand voltage measured to IEC 61000-4-2 is generally lower than that measured using the Human Body Model. Figure 9a shows the IEC 61000-4-2 model and Figure 9b shows the current waveform for the  $\pm 8kV$ , IEC 61000-4-2, level 4, ESD Contact-Discharge Method.
